Postcode - Question
Intro

The following dataset shows the price paid for properties sold in the UK. It includes various columns including the **Post Code** and **Price Paid** of the sold property.

Question

Use the dataset to work out what, on average, are the 10 most expensive post code prefixes.

Dataset

Download the latest monthly price paid data in CSV from here:

- http://prod1.publicdata.landregistry.gov.uk.s3-website-eu-west-1.amazonaws.com/pp-monthly-update-new-version.csv
- http://prod.publicdata.landregistry.gov.uk.s3-website-eu-west-1.amazonaws.com/pp-monthly-update-new-version.csv
- https://prod.publicdata.landregistry.gov.uk.s3-website-eu-west-1.amazonaws.com/pp-monthly-update-new-version.csv
- *Dataset source reference (not required)*

https://www.gov.uk/government/statistical-data-sets/price-paid-data-downloads

Data Guidance

- There are no headers in the file.
- The **2nd column** is the **Price Paid** amount and the **4th column** is the **Post Code**
- The postcode prefix is the first part of the postcode e.g for **SE16 7TG** the prefix would be **SE16**
- Take a close look at the example input and output example below as it will help you understand what you need to do.
- It is possible for the postcode column to be blank, albeit rarely.

General Guidance

- We encourage you to look things up on the internet
- We encourage you to use AI tooling (e.g. Github Copilot, Cursor, ChatGPT etc)
- Attempt to balance efficiency with clear code
- You don't need to write tests
- Ask questions if you're not sure

Coding Guidance

- It should be a console app
- Don’t use any external libraries (even though it would be better to use a CSV library).
- Linq is not an external library. Feel free to use it as much as you'd like.
- It's not an OO structuring question. You don't need to use interfaces.

Example

If we had this data:

PostCode	Amount
SE15 2TH	100
SE15 5NY	200
SE12 8TW	33

The output should be:

Prefix	Average
SE15	150
SE12	33
